

DLM09847 - 3 CHANNELS MULTIFUNCTION DATALOGGER

DLM09847 is a multifunctional portable or desktop datalogger. Three independent channels inputs to plug on different probes connected to each single channel or double combined sensors fit to two input channels, e.g. twin thermocouples, relative humidity+temperature, etc. Self-learning probe calibration data by smart chip module placed in to the probe head or cable plug. Functionality: watch, hold, max, min, average, record/logging with prompt reading or timing scan, difference between two inputs, relative reading, simultaneous display readings of the three input channels plus internal reference temperature. Permanent storage of data calibration in to the sensor probe. Serial RS232C output port. Ability to print out in current time or later from archives.

Review of stored data and erasing of data blocks in the memory. Auto power off after 8 minutes if enabled. Scalable input units referred to the physical, linear variable selectable. Instruments inputs can be connected either by micro smart self-cal modules or on alternative directly by physical sensors as like to temperature (platinum elements), thermocouples, relative humidity+temperature, discomfort index, DC voltage (+/-20V), DC current (4/20mA), pressure, air velocity, light energy, etc.
